MADP-gdh gene; NADP-specific glutamate dehydrogenase.

Chlorella sorokiniana

Chlorella sorokiniana

Eukaryota; Viridiplantae; Chlorophyta; Trebouxiophyceae;

Chlorellales; Chlorellaceae; Chlorella.
                               Cock, J.M., Kim, K.D., Miller, P.W., Hutson, R.G. and Schmidt, R.R. A nuclear gene with many introns encoding ammonium-inducible chloroplastic NADP-specific glutamate dehydrogenase(s) in Chloroplastic NADP-specific glutamate dehydrogenase(s)
                                                                                                                                                                         C.sorokiniana

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   submission through www.pseudomonas.com of any proposed changes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             4 t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1: Function experimentally demonstrated in P. aeruginosa.
2: Function of highly similar gene experimentally demonstrated in another organism (and gene context consistent in terms of pathways its involved in, if known).
3: Function proposed based on presence of conserved amino acid motif, structural feature or limited sequence similarity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      an experimentally studied gene. Homologs of previously reported genes of unknown function, no similarity to any previously reported sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /translation="mkmlkrfivkknergllysbgdflavlepgtyrrfdpydrlsle

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
cDNA clones (AAT64529 and AAT64530) respectively code for the alpha cubunit (AAW15408) precursor proteins of an ammonium-inducible, chloroplast-localised NADP-specific glutamate ammonium-inducible, chloroplast-localised NADP-specific glutamate cammonium-inducible, chloroplast-localised NADP-specific glutamate camponium-inducible, chloroplast-localised NADP-specific glutamate camponium-inducible, chloroplast-localised NADP-specific glutamate camponium-inducible precursor proteins are processed to yield mature alpha and beta subunits (see also AAT64547-48) that comprise the active NADP-GDH capper increasing the assimilation of inorganic N into organic N) by cheef. increasing the assimilation of inorganic N into organic N) by cransforming them with nucleotide sequences encoding the alpha and/or beta subunits. Such plants show improved properties, e.g. increased crop yield and improved stress tolerance. Heterohexamers having alpha and beta cubunits can be expressed that have higher aminating:deaminating activity ratios (i.e. higher capacity for glutamate synthesis) than homohexamers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

```
The invention relates to a method of modulating nitrogen metabolism in plant cells, comprising transforming a plant cell with a polynucleotide encoding a polypeptide having glutamate dehydrogenae activity, and culturing the cell to produce descendant cells which express the polypeptide. The method is used to provide plants with increased yield,
                                                                                                            Transforming a plant with a polynucleotide encoding a polypeptide glutamate dehydrogenase activity provides a plant with modulated r metabolism useful to increase yield and ammonium and osmotic stresmetabolism
                                                                        Disclosure; Page 11-13; 35pp; English.

DNA encoding NADP-GDH alpha and beta sub-units - isolated from Chlorella sorokiniana algal protoplast(s), useful to modulate nitrogen metabolism

Claim 2; Page 40-41; 61pp; English.

CDNA clones (AAT64542 and AAT64543) respectively code for the alpha subunit (AAW15407) and beta subunit (AAW15408) precursor proteins of an ammonium-inducible, chloroplast-localised NADP-specific glutamate dehydrogenase (NADP-GDH) of Chlorella sorokiniana. They were obtd. by ligation of 3' clone pBGDG53 (AAT64531) and 5' clones pGDG63 (AAT64540) and pGDC64 (AAT64541). The proteins are processed to yield mature alpha and beta subunits (see also AAT64547-48) that comprise the active NADP-GDH hexameric isoenzymes. The nitrogen metabolism of plants can be modulated (pref. by increasing assimilation of inorganic N into organic N) by transforming them with nucleotide sequences encoding the alpha and/or beta subunits. Such plants show improved properties, e.g. increased crop yield and improved stress tolerance. Heterohexamers having alpha and beta subunits can be expressed that have higher capacity for glutamate sinthesis) than homohexamers. (Updated on 17-CCT-2003 to standardise OS eight) synthesis) field)

                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method of modulating nitrogen metabolism in plant cells, comprising transforming a plant cell with a polynucleotide encoding a polypeptide having glutamate dehydrogenase activity, and culturing the cell to produce descendant cells which express the polypeptide. The method is used to provide plants with increased yield, improved ammonium assimilation properties, increased tolerance to ammonia coxicity, improved osmotic stress tolerance and improved composition. The present sequence represents the coding sequence of Chlorella sorokiniana NADP-glutamate dehydrogenase ligation construct of pBGDC53 plus pGDC63, used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Transforming a plant with a polynucleotide encoding a polypeptide with glutamate dehydrogenase activity provides a plant with modulated nitrogen metabolism useful to increase yield and ammonium and osmotic stress
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (SCHM/)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    NADP-specific glutamate dehydrogenase; NADP-GDH; alpha subunit; alga; nitrogen metabolism; plant; ammonium assimilation; transgenic; ammonia toxicity tolerance; osmotic stress tolerance; pGDc63; pGDc63;

CC CDNA clones (AAT64529 and AAT64530) respectively code for the alpha CC subunit (AAW15407) and beta subunit (AAW15408) precursor proteins of an CC ammonium-inducible, chloroplast-localised NADD-specific glutamate CC dehydrogenase (NADP-GDH) of Chlorella sorokiniana. They were deposited in CC E. coli DH5alpha as ATCC 69925 and 69926, respectively. The precursor CC proteins are processed to mature alpha and beta subunits (see also CC AAT64547-48) that comprise active NADP-GDH hexameric isoenzymes. The CC nitrogen metabolism of plants can be modulated (pref. increasing the CC assimilation of inorganic nitrogen into organic nitrogen) by transforming CC them with nucleotide sequences encoding the alpha and/or beta subunits. CC Such plants show improved properties, e.g. increased crop yield and CC improved stress tolerance. Heterohexamers having alpha and beta subunits CC can be expressed that have higher aminating deaminating activity ratios CC (i.e. higher capacity for glutamate synthesis) than homohexamers.

The method is used to provide plants with increased yield, improved ammonium assimilation properties, increased tolerance to ammonia toxicity, improved osmotic stress tolerance and improved composition. The present sequence represents the coding sequence of Chiorella sorokiniana MADP-glutamate dehydrogenase beta subunit, used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Transforming a plant with a polynucleotide encoding a polypeptide with glutamate dehydrogenase activity provides a plant with modulated nitrogenabolism useful to increase yield and ammonium and osmotic stress
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (SCHM/)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC cDNA clones (AAT64542 and AAT64543) respectively code for the alpha CC combinit (AAW15407) and beta subunit (AAW15408) precursor proteins of an amnonium-inducible, chloroplast-localised NADD-specific glutamate CC ammonium-inducible, chloroplast-localised NADD-specific glutamate CC dehydrogenase (NADD-GDH) of Chlorella sorokiniana. They were obtd. by CC ligation of 3' clone pBGDc53 (AAT64511) and 5' clones pGDc63 (AAT64540) and pGDc64 (AAT64541). The proteins are processed to yield mature alpha CC and beta subunits (see also AAT64547-48) that comprise the active NADD-CC (CC proteins) by increasing assimilation of inorganic N into organic CC (CC proteins) them with nucleotide sequences encoding the alpha CC and/or beta subunits. Such plants show improved properties, e.g. CC increased crop yield and improved stress tolerance. Heterohexamers having CC alpha and beta subunits can be expressed that have higher capacity for glutamate synthesis) than homohexamers. (Updated on 17-CCT-2003 to standardise OS creatals)
